

## A Case of the 10 days

### Case 394

A seventy-year-old female presented in our hospital for anal bleeding. She had a past illness history of neurogenic gastritis, lumbar hernia, lumbar spondylolisthesis, and hemorrhoids. She took CT for further investigation (Figs 1-3).

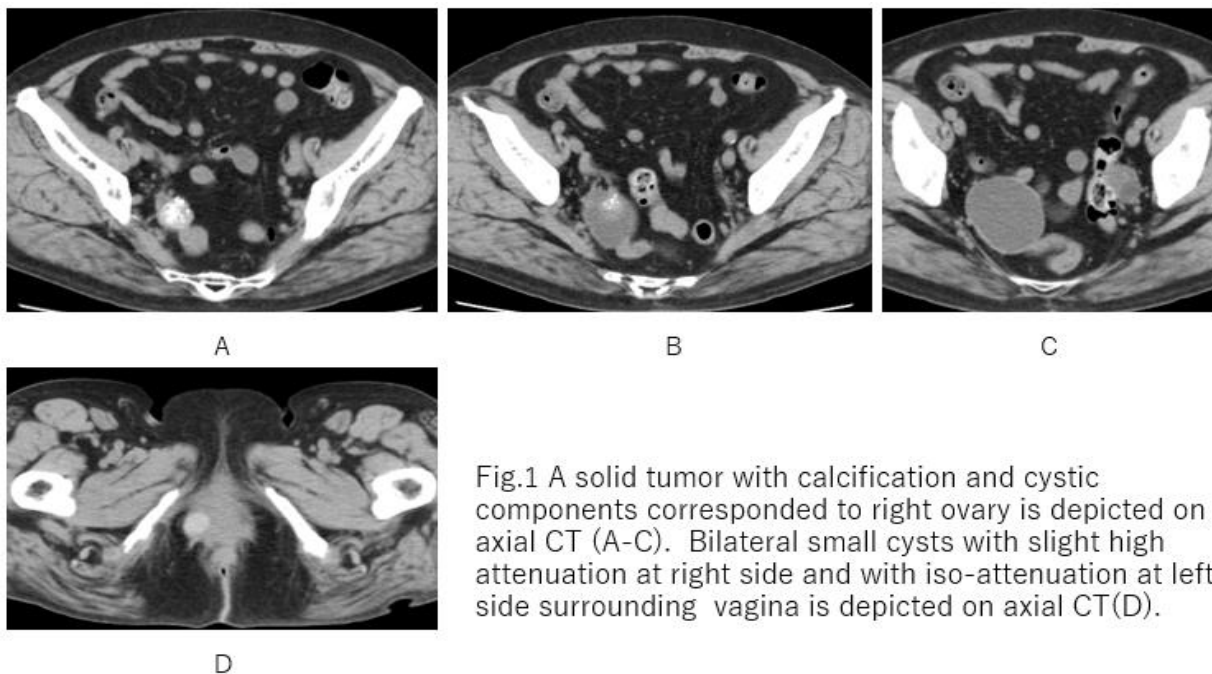

Fig.1 A solid tumor with calcification and cystic components corresponded to right ovary is depicted on axial CT (A-C). Bilateral small cysts with slight high attenuation at right side and with iso-attenuation at left side surrounding vagina is depicted on axial CT(D).

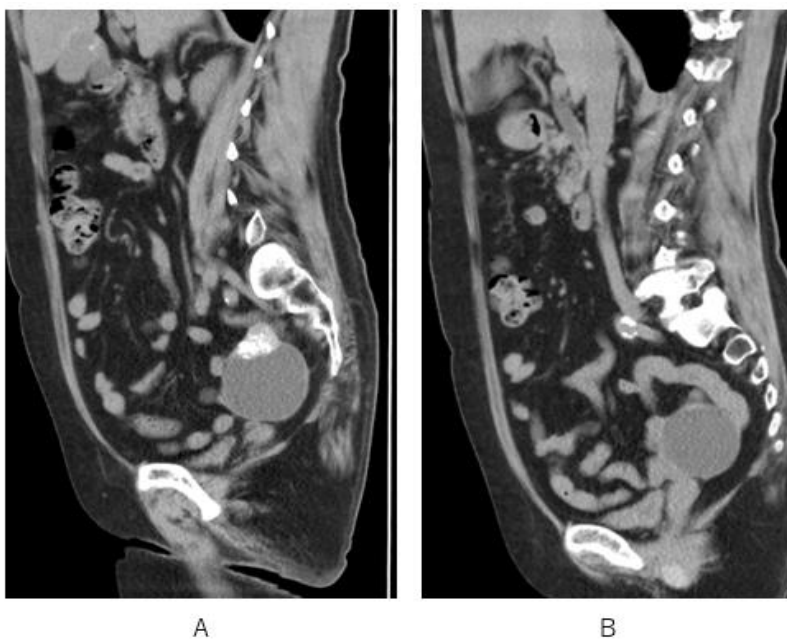

Fig.2 A solid tumor with calcification and cyst corresponded to right ovary is depicted on sagittal CT(A). A cystic tumor with high attenuation is depicted on right side of vagina (B).

A

Fig.3 Both a lesion composed of solid part with calcified cyst part corresponded to right ovary and bilateral small cysts surrounding vagina are depicted on coronal CT.

What is an imaging diagnosis?

---

1. Dermoid cyst
2. Teratoma
3. Fibroma
4. Brenner tumor
5. Mucinous cystadenoma

answer
